### SUMMARY

IT engineer responsible for the infrastructure of a six-company automotive dealer group — more than 30 branch offices, 500+ Windows endpoints and six independent Active Directory domains. I do not only operate that environment, I build the tooling that runs it: an in-house RMM (PowerShell agents, PostgreSQL, Node/React dashboard), five internal MCP servers over PostgreSQL and SQL Server, an AD + Google Workspace provisioning app, and an LLM agent gateway whose security-critical paths run as deterministic code instead of model output. I work read-only by default, require explicit confirmation before destructive actions, and document every system so the next person does not have to rediscover it.

### TECHNICAL SKILLS

- **Infrastructure & OS:** Windows 10/11, Windows Server, Active Directory (LDAP, OUs, groups, GPO), DNS, DHCP, TCP/IP, multi-site VPN, MikroTik, FortiGate NAT/DDNS, Linux (Ubuntu, Debian), Hyper-V environments
- **Endpoint & ITSM:** PDQ Inventory, Kaspersky Endpoint Security, Zammad, OTRS, Google Workspace Admin SDK and GAM, hardware diagnostics, imaging and workstation rollouts
- **Automation & scripting:** PowerShell, Python (pyodbc, ReportLab), Bash, Node.js, Windows Task Scheduler
- **Development:** Node.js / Express, React, Next.js, TypeScript, TailwindCSS, REST APIs, PostgreSQL, SQL Server, SQLite, Git / GitHub, Vitest
- **AI engineering:** multi-agent orchestration and delegation, per-agent tool policies, MCP server development, deterministic pre-inference interception, local models (Ollama), Gemini API
- **Practices:** technical documentation and runbooks, security review, least-privilege and read-only access design, append-only audit logging, change history

### PROFESSIONAL EXPERIENCE

#### IT & Systems Engineer — Autotag S.A. (Grupo Helper)

Jul 2026 – Present

*Systems department serving six related dealership companies, each with its own network and Windows domain, across more than 30 branch offices. Buenos Aires, Argentina.*

- Built and operate **Helper Inventory**, an in-house RMM platform: a PowerShell agent running as SYSTEM through a Scheduled Task on every workstation, a PostgreSQL back end, a Node/Express API and a React/Vite dashboard. Covers hardware and software inventory, antivirus and disk alerts, online/offline state and a remote command terminal (message, reboot, gpupdate, PowerShell). Tracking **500+ endpoints across six companies**, rolled out through six PDQ Inventory servers.
- Diagnosed why roughly **146 workstations at one company had never reported**: the agent had never been installed there — not the network fault everyone assumed. Documented the check so the next engineer starts at the scheduled task instead of the firewall.
- Produced the group's first cross-company server inventory: swept **84 reference addresses across six /24 subnets** and catalogued what answered — domain controllers, Hyper-V hosts, SQL Server, NAS, RemoteApp, accounting servers and camera DVRs — resolving names against each company's own DNS. Proved that parallel ping sweeps produce false negatives — a live domain controller was reported down — and rewrote the procedure as sequential with retries.
- Extended an internal **Active Directory + Google Workspace provisioning app** (Express, ldapjs, googleapis Admin SDK, React/Vite/Tailwind, per-company tenant config): implemented AD account unlock via the `lockoutTime` attribute and wired unlock and disable into a four-step confirmation flow. Established that AD password reset is blocked until LDAPS is enabled on each domain controller — an infrastructure change, not a code change.
- Replaced a legacy Crystal Reports management report with **Python 3.12** (pyodbc + ReportLab): queries SQL Server, rebuilds the original formulas in code, emits an A4 landscape PDF and delivers it by SMTP, with a PowerShell launcher, dated copies and monthly logs.

- Migrated ~**755 files of undocumented shared-drive material spanning 2008–2026** into a structured knowledge base of infrastructure notes, runbooks and procedures, and reported the plaintext credentials found in that share and in internal repositories with concrete remediation steps.

#### Agent platform and internal tooling — same role

- Designed a Telegram-facing operations gateway on an LLM agent runtime: one orchestrator delegating to **four isolated specialist agents** (inventory, reporting, user accounts, help desk), each with its own workspace and an explicit tool deny-list enforced at gateway level — no write, exec or process capability for read-only domains.
- Moved every reliability- and security-critical path out of the model and into code, as a custom runtime plugin: regex intent interception before the model sees a message, direct Node access to PostgreSQL and SQL Server, parallel ping sweeps, and direct binary delivery to the Telegram API. Structured queries dropped from **60–150 s of model inference to under 2 s**; a generated PDF report now reaches the chat end-to-end in under two seconds.
- Wrote **five MCP servers in Node** exposing PostgreSQL and SQL Server 2008 R2 to the agents through fixed parameterized queries only — no free-form SQL reachable by the model, password columns excluded by construction, and a code-level table allowlist rather than an instruction in a prompt.
- Ran a full security review of the platform and fixed **seven critical findings the same day**: prompt-only access rules replaced with real code checks, atomic writes for the permissions file, raw LDAP/SQL errors no longer forwarded to end users, destructive test scripts that wrote to production quarantined, and an append-only JSONL audit log for the deterministic actions the runtime's own audit trail could not see.
- Built **Mission Control**, a Next.js 16 + SQLite dashboard for the agent fleet: rebuilt its floor view on a fixed 32 px grid with integer-only zoom, routed agents by domain, and added 19 tests covering routing and map integrity.

#### IT Support Technician — Alcanzo S.A. (Movistar contractor)

Jan 2024 – Jul 2026

*High-volume call center operation. Buenos Aires, Argentina.*

- Level 1–2 support for call center workstations: hardware and software incidents, peripheral diagnostics, component replacement, and Windows installation, configuration and maintenance.
- Handled ticket intake, categorization, escalation and follow-up, and wrote up recurring fixes for the internal knowledge base.
- Automated repetitive maintenance and verification tasks with PowerShell and Bash, removing manual steps from scheduled work.

#### PERSONAL PROJECTS

---

- **remote-monitoring-dashboard** (TypeScript) — monitoring dashboard for remote endpoints.
- **AssetDesk** (JavaScript) — IT asset management workspace with device inventory, ticketing and user directory.
- **CommerceSuite** (JavaScript) — B2B procurement platform with inventory tracking and status auditing.

#### LANGUAGES & AVAILABILITY

---

- **Languages:** Spanish (native). English — professional technical reading and writing; spoken intermediate, actively improving.
- **Availability:** Full-time remote. Based in Buenos Aires (UTC–3), overlapping a full working day with US Eastern and Central hours.
